# STAINED GLASS TECHNIQUE

A wide range of stained-glass windows and doors are presented in the product range by KORSA TM. Constructions with stained glass fill the room with - extraordinary colors, lights and shades. Images vary from florets to numerous graphical illustrations and abstract pictures. Stained glass windows are mostly used for decoration of facades, back yards and verandahs.

## MANUFACTURING PROCESS

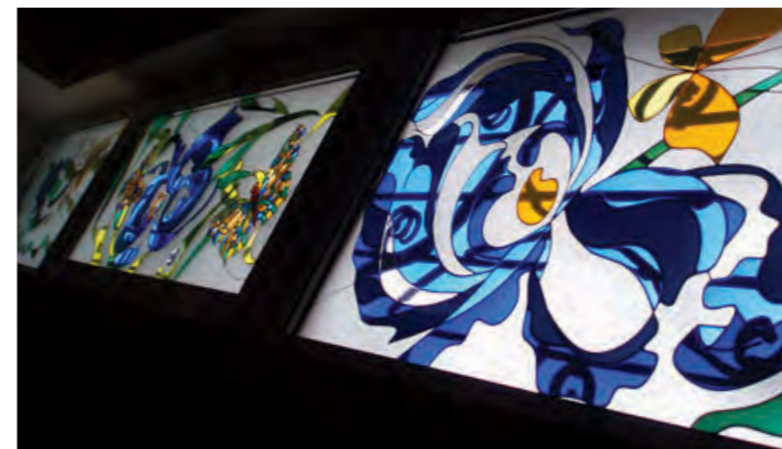

According to the production technology, stained glass is produced with the help of special machine which applies picture contour and fill it with a mixture of polyurethane polish and paint. After being dried the substance turns into strong and highly adhesive coating resistant toward weather conditions, ultraviolet and mechanical influence. Stained glass is protected to the maximum if it is placed inside the double IG-unit. Paint application can be applied to both matted and transparent glass surfaces.

**STAINED GLASS WITH METAL CONTOUR** is produced according to the same technology. The difference consists in application of metal contour around the picture which results into extra dimension of the glass.

We also like to use **COMBINED TECHNIQUES** aiming for uniqueness and sophistication.

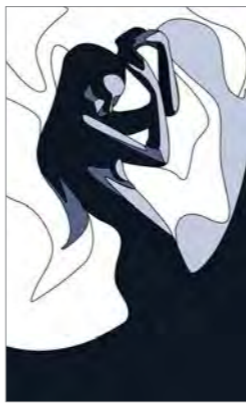

Readymade stained-glass is completely safe for being installed in a kid's room. Polymeric contours as well as polyurethane polish are not toxic. Calculation of the construction with stained glass is done individually based on the construction size.

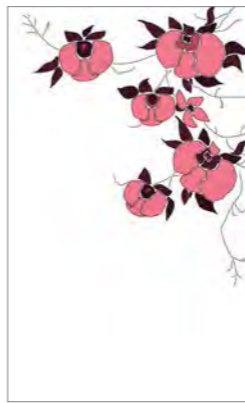

Stained glass windows are mostly used for decoration of facades, back yards and verandahs. Such constructions can be washed and cleaned the same way as traditional windows thus they serve during the whole period of the window usage.

## FACETS

### KORSA™ OFFERS A WIDE RANGE OF FACETS FOR DECORATION OF IG-UNITS IN WINDOW AND DOOR CONSTRUCTIONS

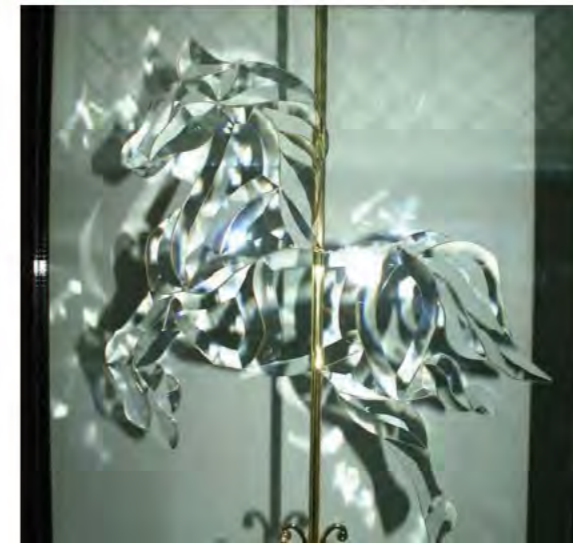

Facets are also used in combination with stained glass technique. Application of small and elegant glass pieces change any standard flat glass into beautiful work of art.

**FACETS** are figured glass elements used for decoration of non-standard IG-units and stained glasses. Hundreds and hundreds of diverse glass particles vary from simplest to ones containing tens of elements. Facets are produced from flat glass 5 or 6 mm width with edges cut at an angle.

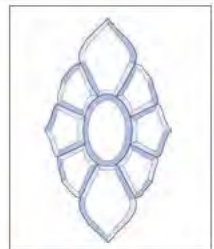

The wide range of facets is formed thanks to numerous combinations of glass colors and sizes. Facet décor can contain simply **one glass element** as well as combine **numerous glass pieces** into a sophisticated design.

Facets are fixed to the base by glue and afterwards intensified by ultraviolet rays. This method is defined as the most successful and effective nowadays. Strength of a juncture is extremely high as facets are produced from glass of one piece. After facets have been applied each finished product is thoroughly tested in order to guarantee high quality and excellent look of the construction.

Facet compositions add depth, elegance and originality to the construction. Thank to sunlight refraction and beautiful shine the same composition can look absolutely unique if you observe the construction from different angles. Experimenting with shapes, colors and facet design allow expressing your individual taste and style.
